Reflection

On the home page. At first glance you'll see that the Welcome text and the paragraph underneath didn't fit the page. It would have looked better if they were bigger. The navigation text buttons aren't the same as the prototype. Manged to put them all on one side. But what's good is I have an articles section, about me page and a contact page.

'Coppdesigns' made it clickable that takes you always back to the homepage. The bio which takes you to the about me section. A profile of the client, description to the left, profile on the right and a resume underneath.

Articles displaying art pieces with a preview of description under each one. Some are for fun, others for work and others are personal projects. When clicking on the first artwork it takes u to a more focused page of that specified artwork u pressed on and it gives you more of the thought/work process.

Articles issues. Not aligned and the last art (postcard)doesn't fill the whole container just like in the prototype. In the focused article page. The text is at the top and no space between the text and image. And paragraph not centred in the middle. Could've increased the size as well to help fill the space more.

Contact displaying a paragraph with gmail.com. Same issue as the home page. Header and paragraph small.

About me page(bio) the background doesn't fill the whole background in black

Focused articles didn't include next and previous buttons (left and right). So, there wouldn't be needed to go back to the list of articles.

Positives: managed to implement what was right as paragraphs in code and if they were on the left in the prototype. I put the paragraph to the left. Managed to make the image clickable and put the image on the left.

Functions my client would like to see.

In the focused article page, they suggested that I should make the image clickable and takes you to a page where the image fills the screen so you can see the image up close.

Or change the structure of the text and image, instead of next to each other. Make the image in the middle and make it bigger with the paragraph underneath.

They wished also for the Gmail to be a link for easy access.

They suggested also to add behind the scenes images of her designing. To show viewers an idea of the environment and atmosphere makes the viewers interreact more with the viewers.
